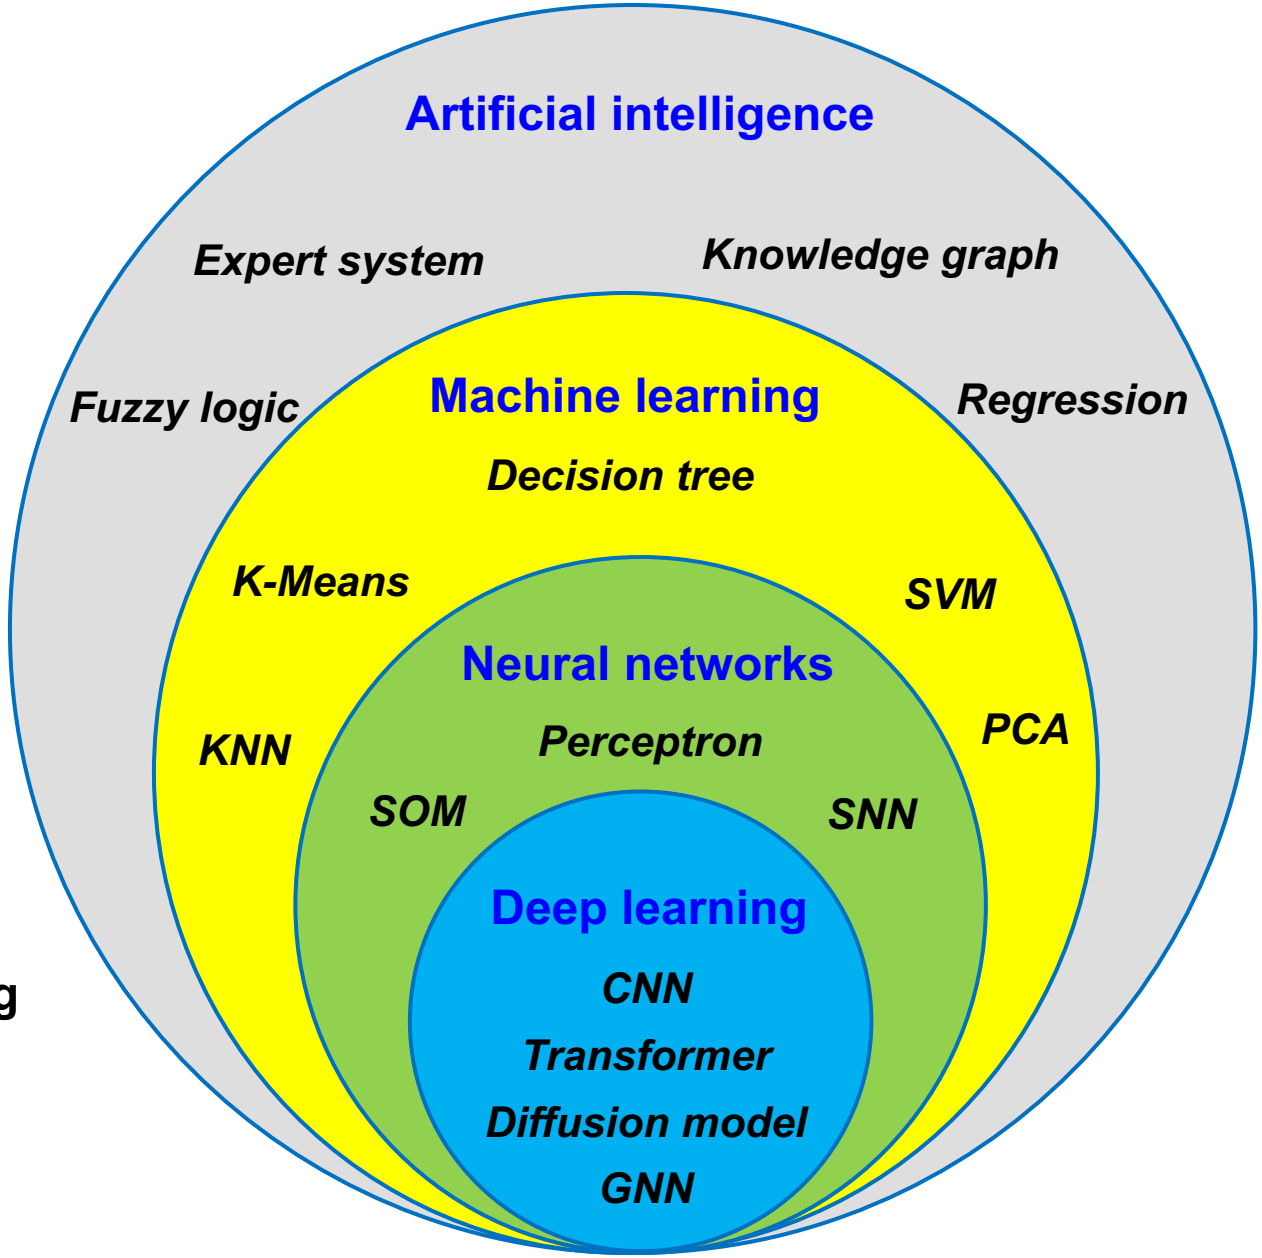
Introduction

- Primer for those who are unfamiliar with deep learning methods
- A high-level view of deep learning strategy and methods
- Deep learning has been successfully applied in single-cell data analyses

AI Scope



- Unsupervised learning
- Supervised learning
- Self-supervised learning
- Reinforcement learning

Supervised Machine Learning

- Apply a prediction function to a feature representation of image to get the desired output:

f() = “apple”

f() = “tomato”

f() = “cow”

$$y = f(\mathbf{x})$$

Output (label)

Prediction function

Image feature

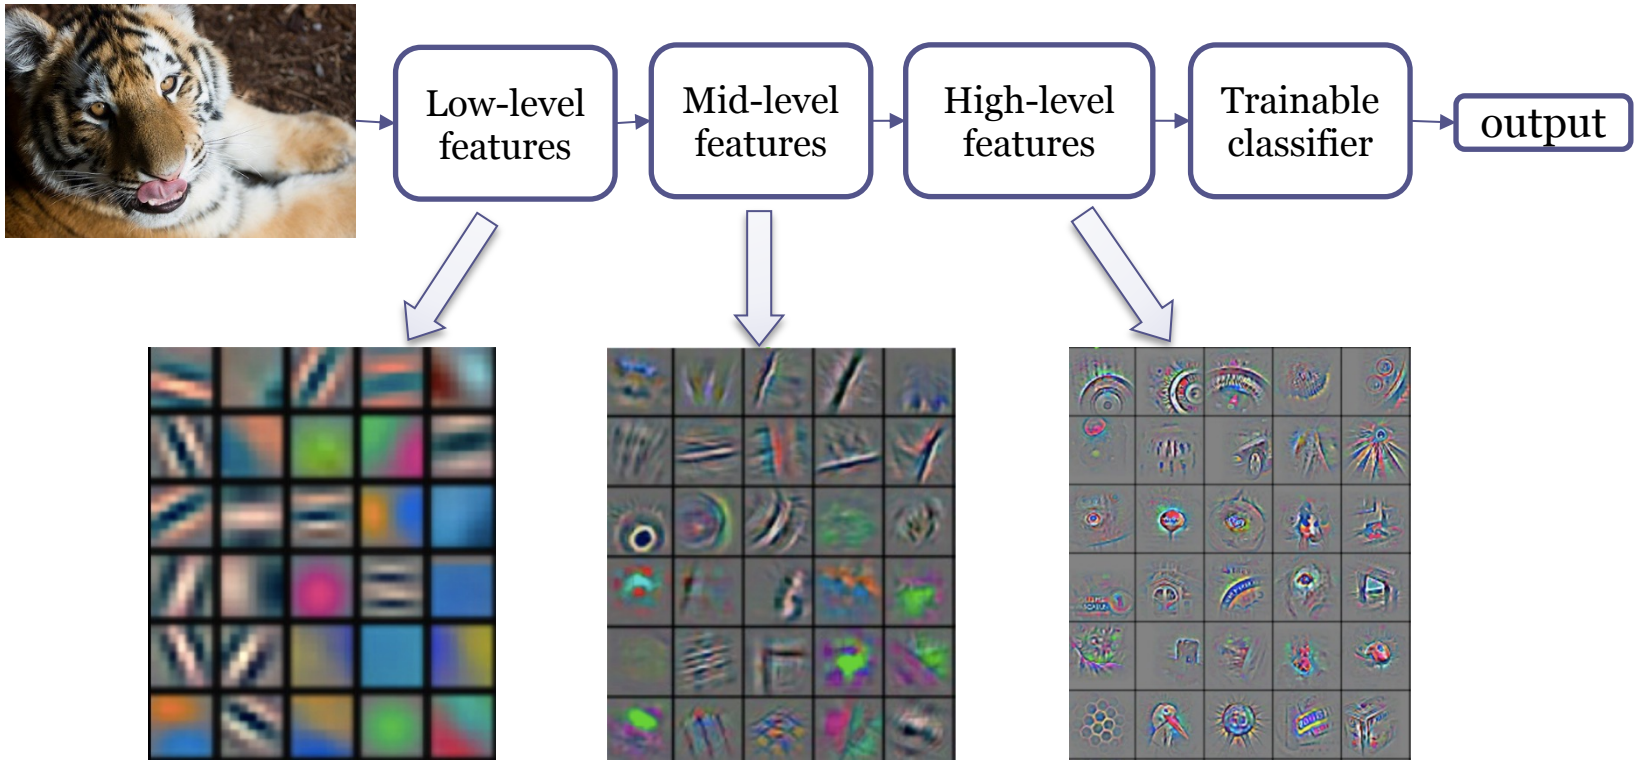
Generalization

Training set (labels known)

Test set (labels unknown)

- How well does a learned model generalize from the data it was trained on to a new test set?

Learning Hierarchical Representations



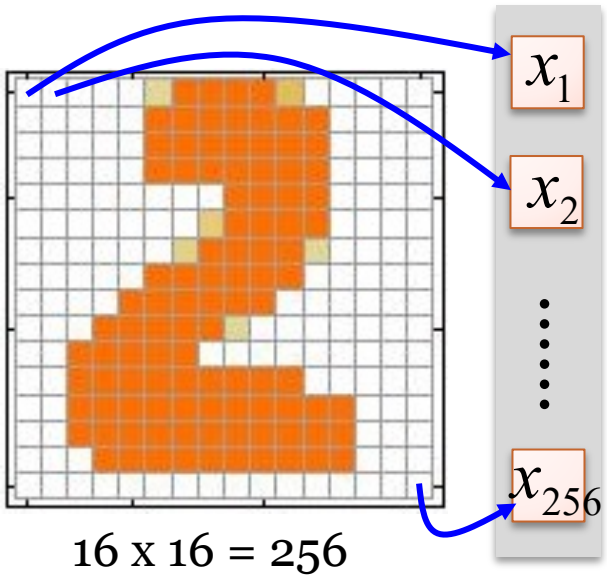
Hierarchy of representations with increasing level of abstraction

Deep learning

raw features, deep/sophisticated architectures, more data, more compute

Handwriting Digit Recognition

Input

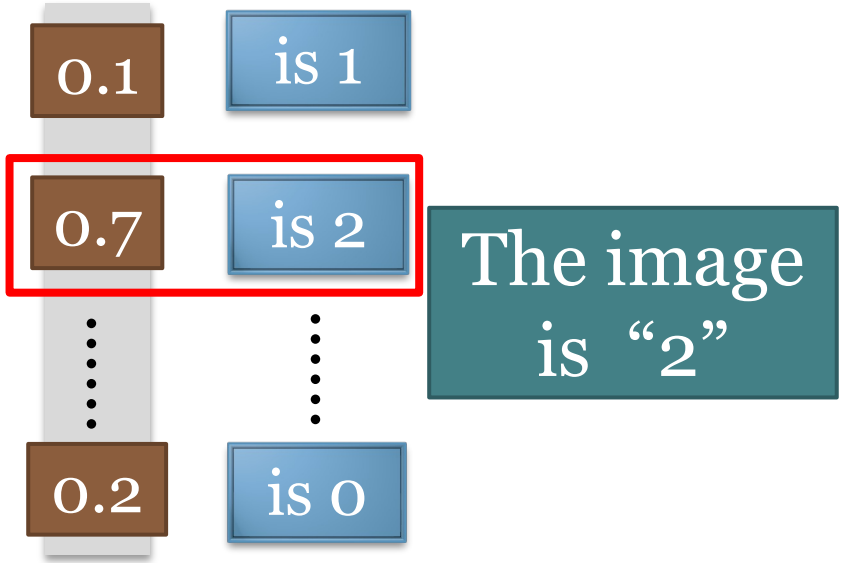


16 x 16 = 256

Ink → 1

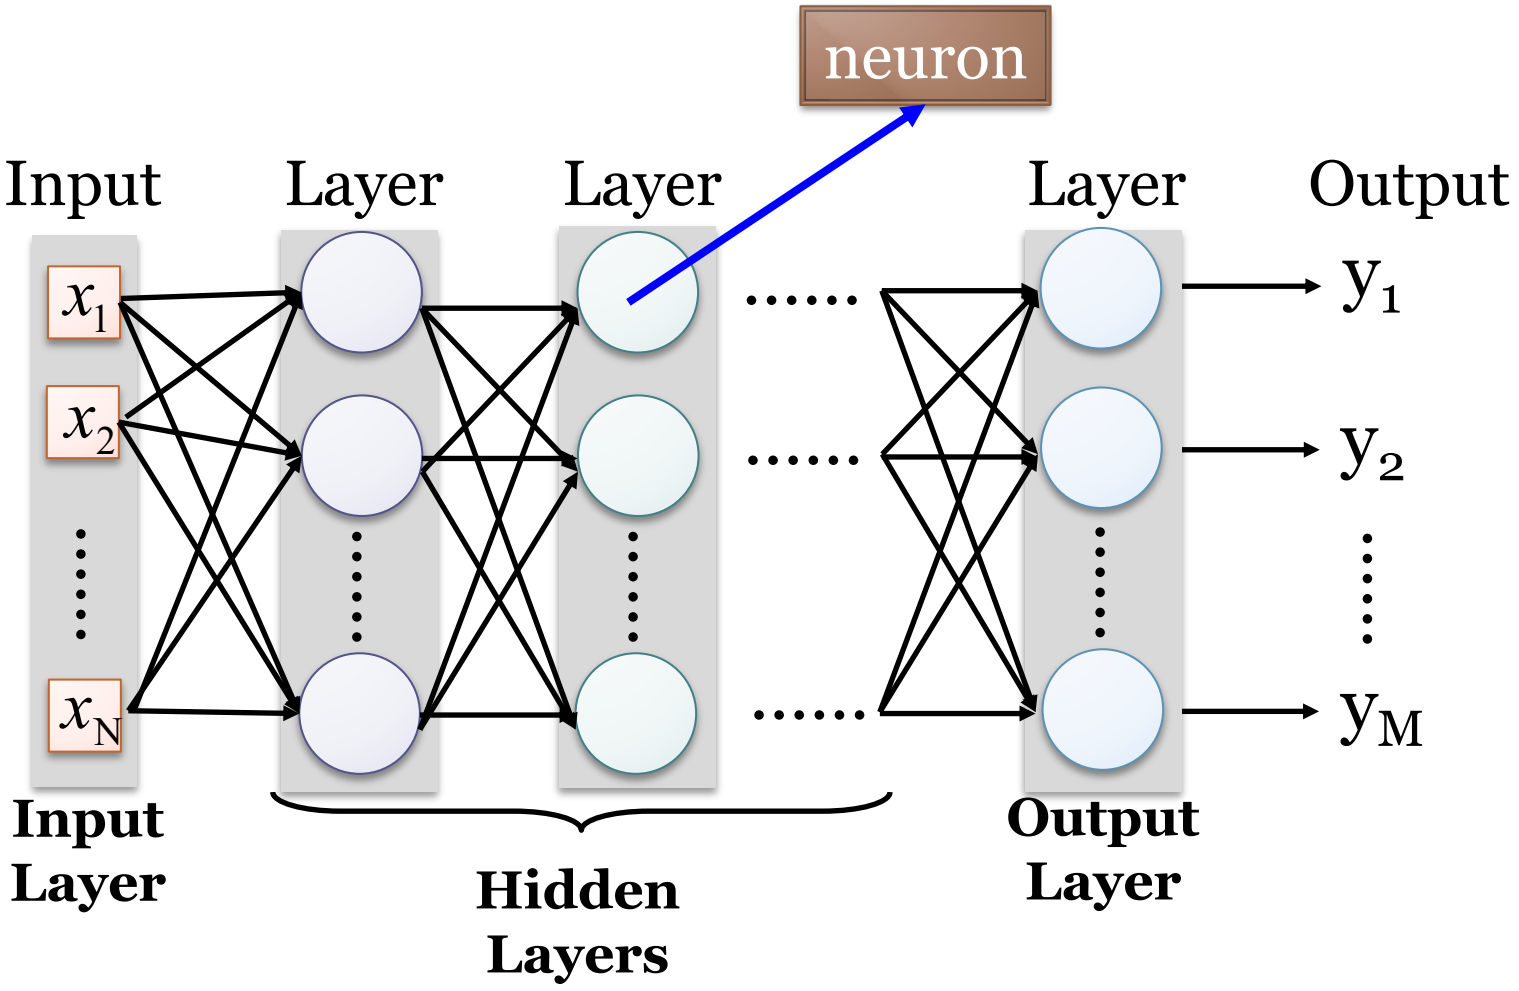
No ink → 0

Output



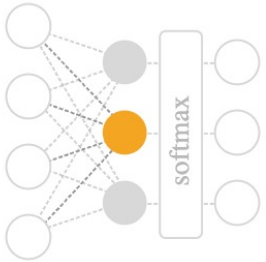
Each dimension represents the confidence of a digit.

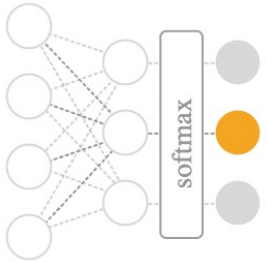
Deep Neural Network (DNN)



Deep means many hidden layers

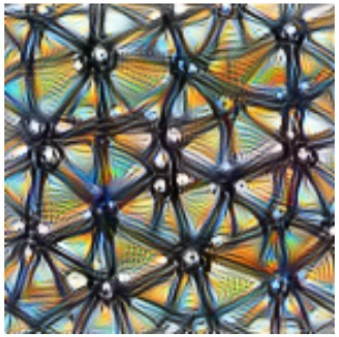
Latent Representation





Neuron

$layer_n[x,y,z]$



Channel

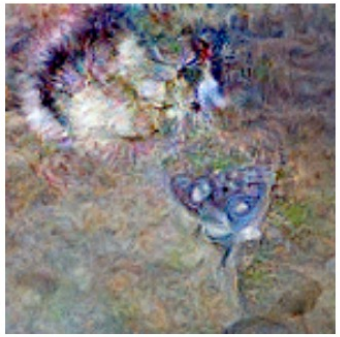
$layer_n[:,:,z]$

Layer/DeepDream

$layer_n[:,:,:]^2$

Class Logits

`pre_softmax[k]`



Class Probability

`softmax[k]`

Abstraction and Representation

physical space → latent/embedding space (manifold)

photo

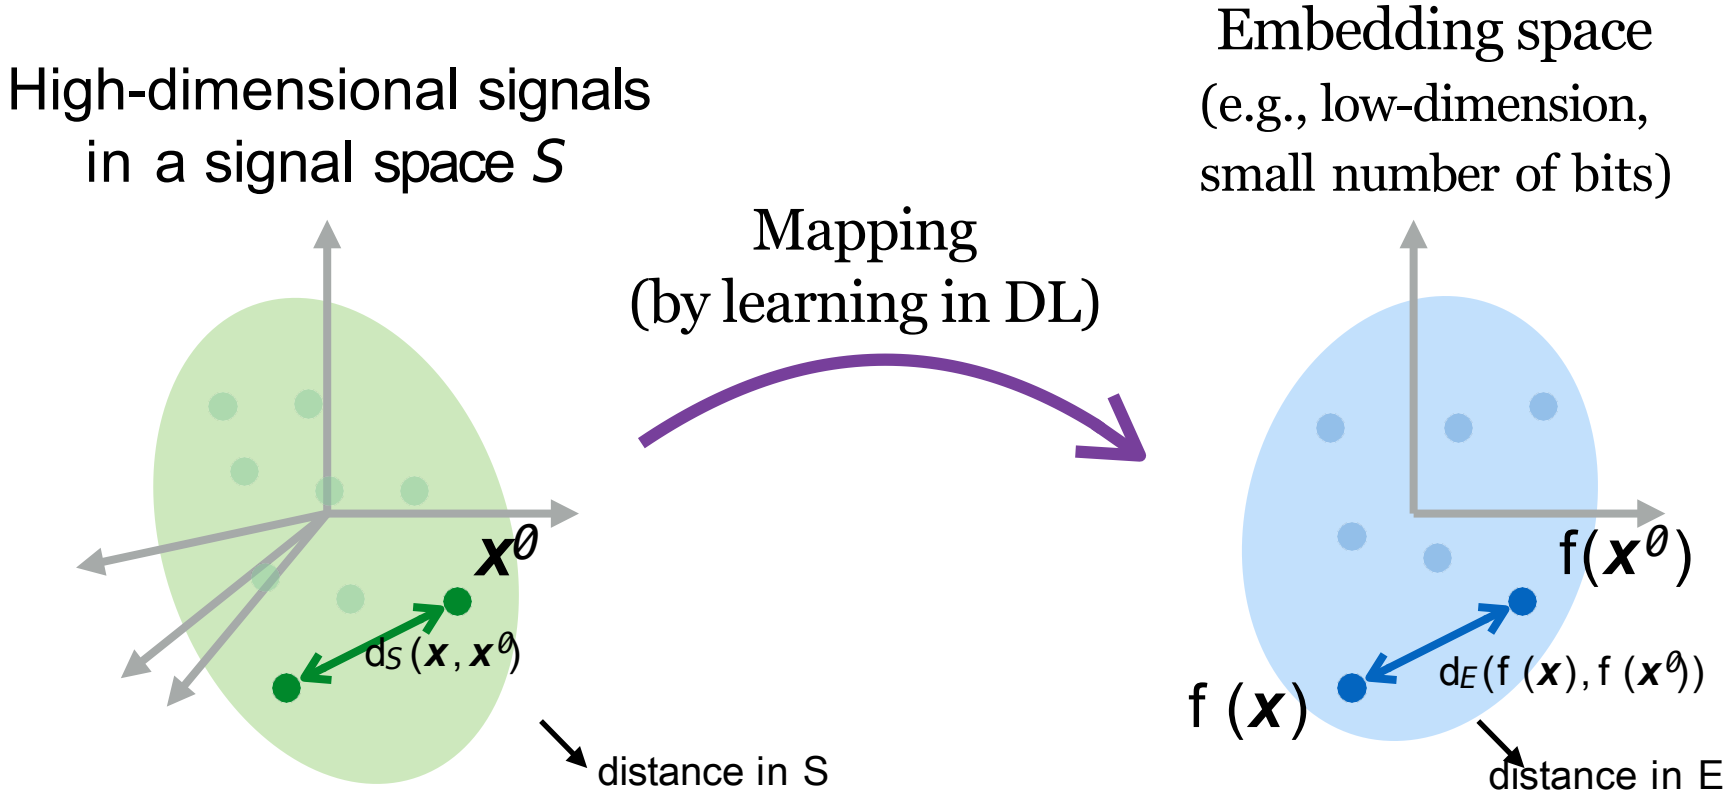
impressionism

expressionism

cubism

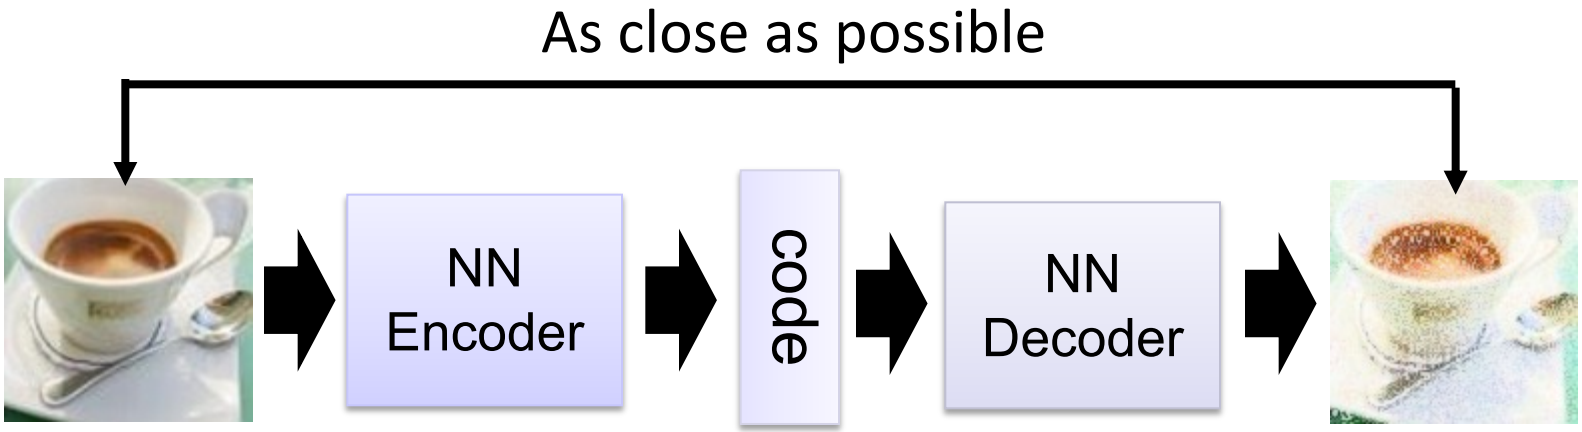
abstract expressionism

Unsupervised Learning & Embedding



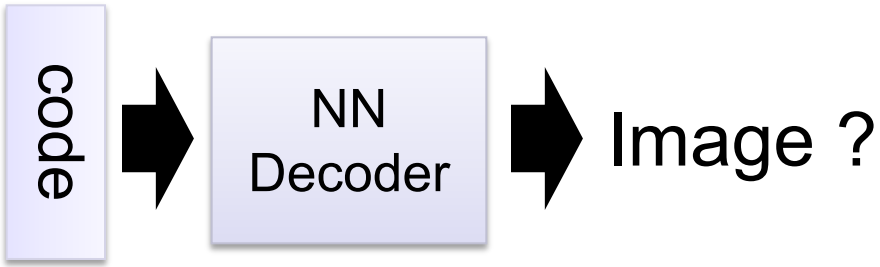
An embedding is a function from an original space to an embedding space that preserves aspects of the geometry of the original space

Autoencoder

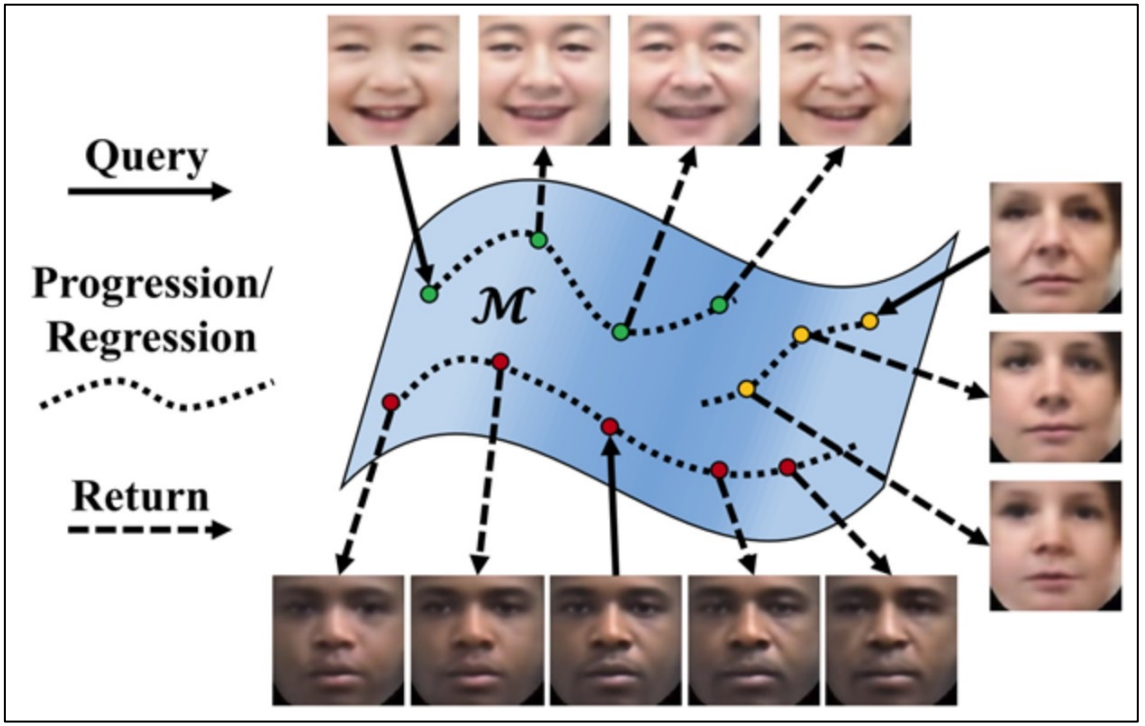


A type of unsupervised learning which discovers generic features of the data (**learn data patterns**)

Randomly generate a vector as code



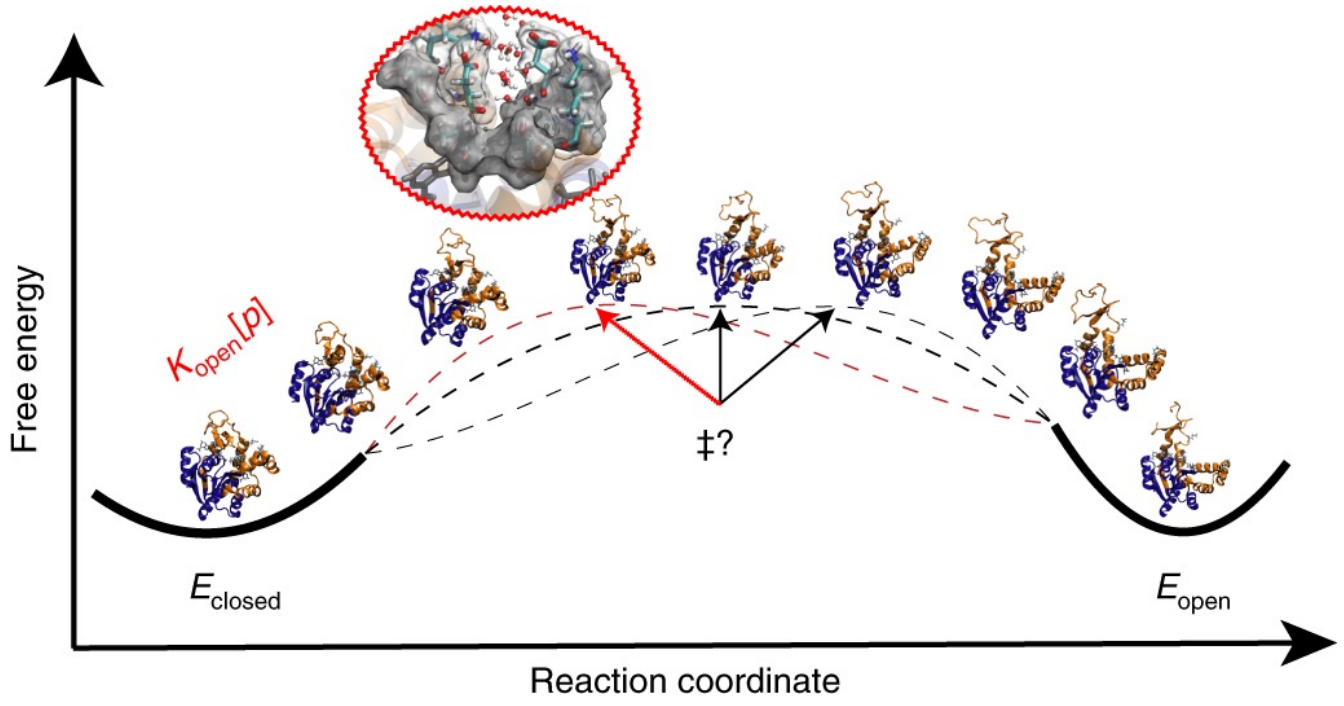
Manifold



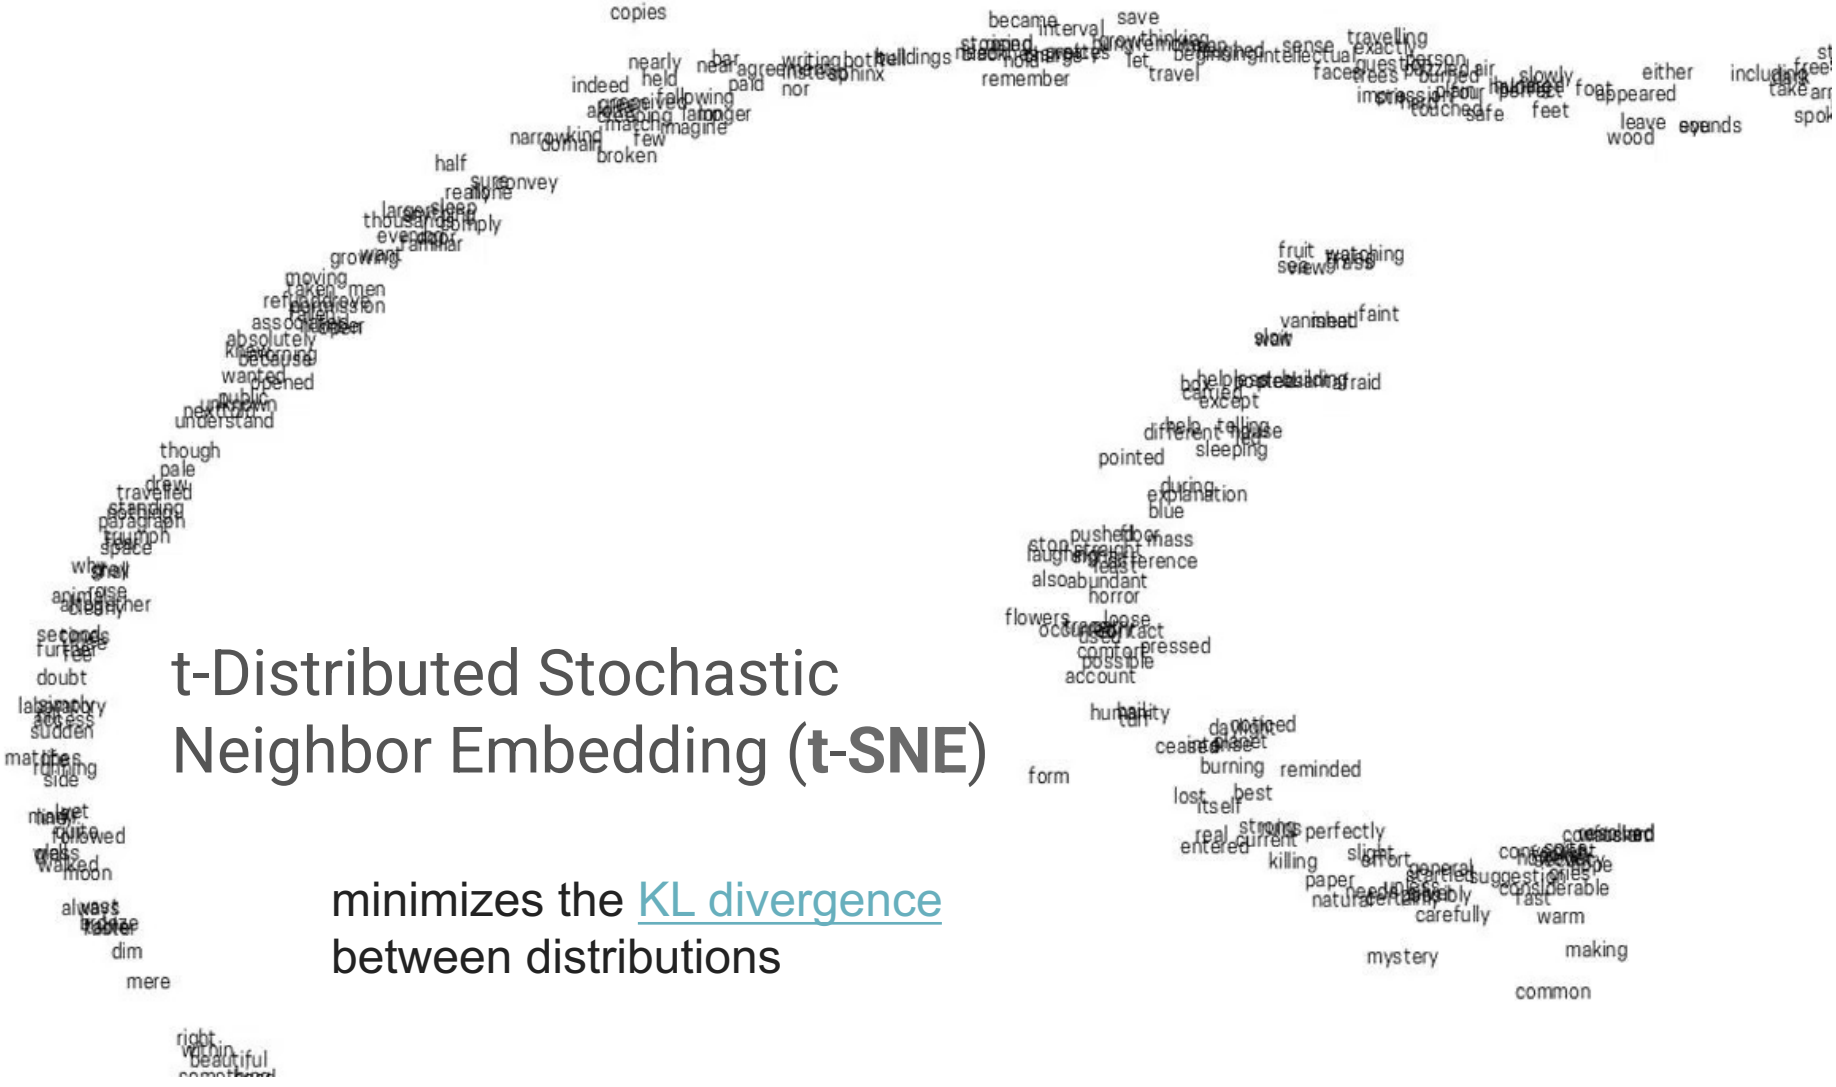
- A Manifold is a topological space that locally resembles Euclidean space near each point
- n-dim manifold → topological space M, every point x ∈ M has a neighbor homeomorphic (isomorphismic) to Euclidean space Rn

Manifold Hypothesis

- **Deep Learning Central Hypothesis**: Data concentrates around a low-dim manifold (**relevant dimension**)
- Mimic human learning



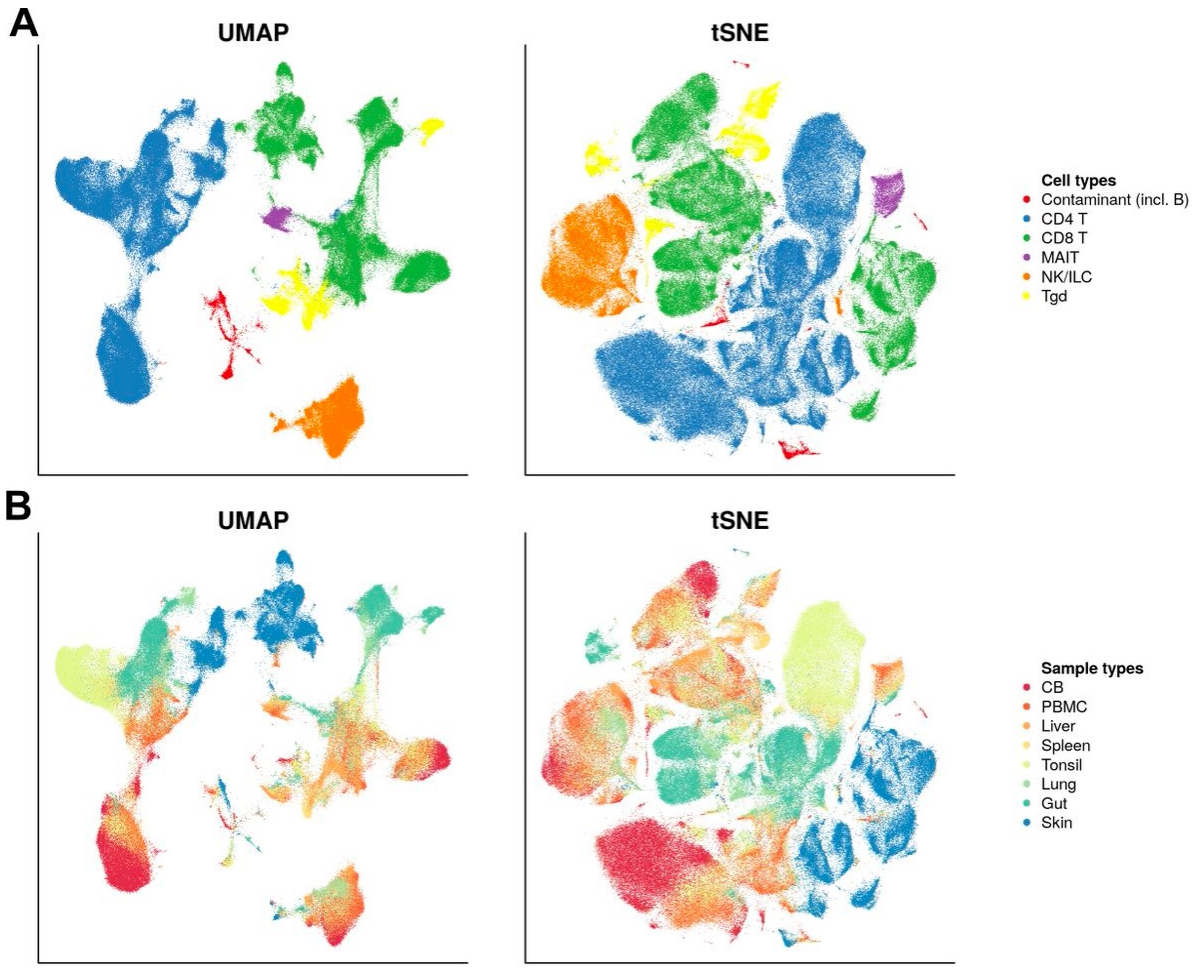
T-SNE Visualization



U-Map

Uniform Manifold Approximation and Projection (UMAP)

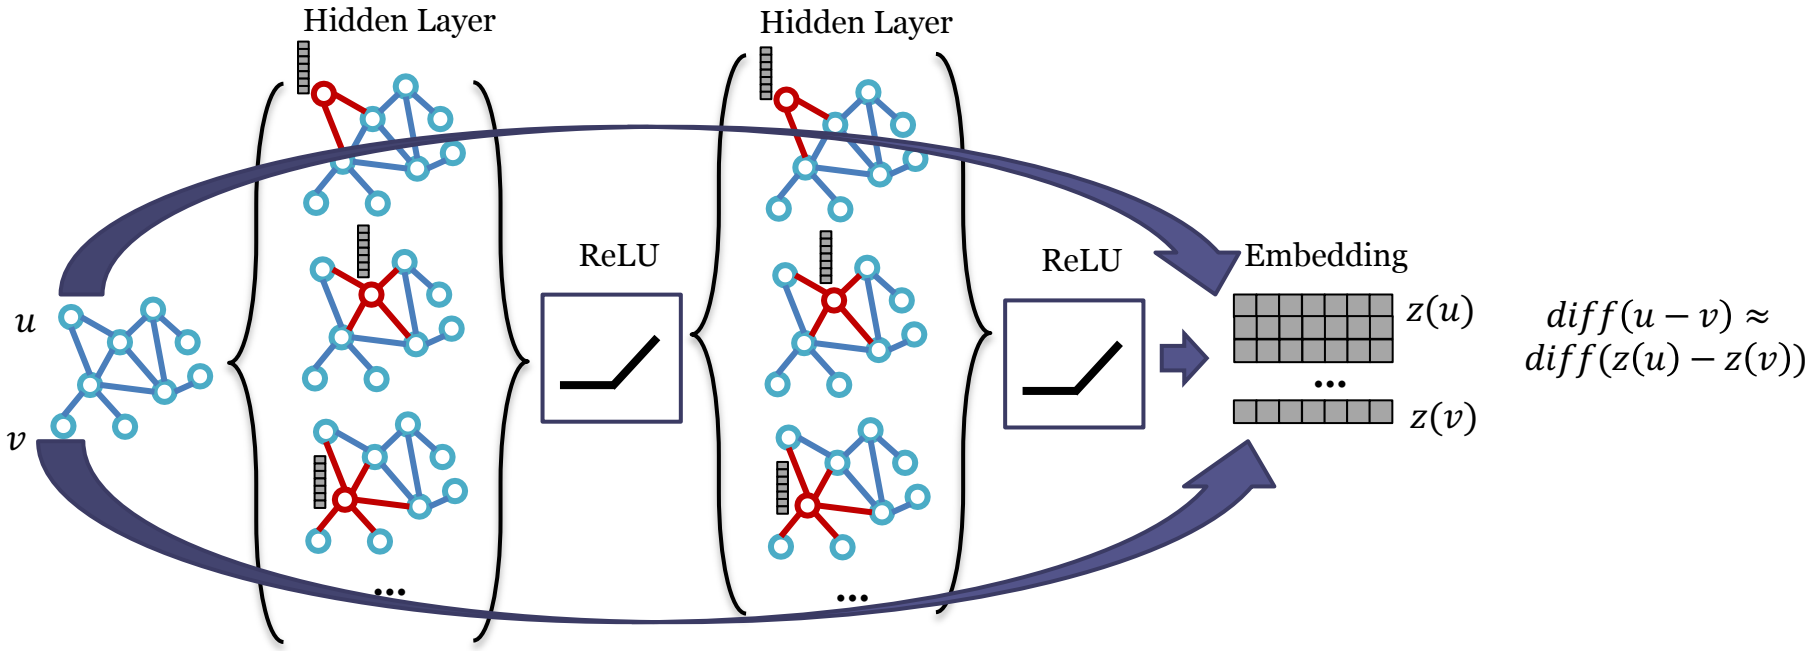
find a topological representation of the data in a lower dimensional space through manifold learning technique



https://github.com/lmcinnes/umap

Graph Neural Network (GNN)

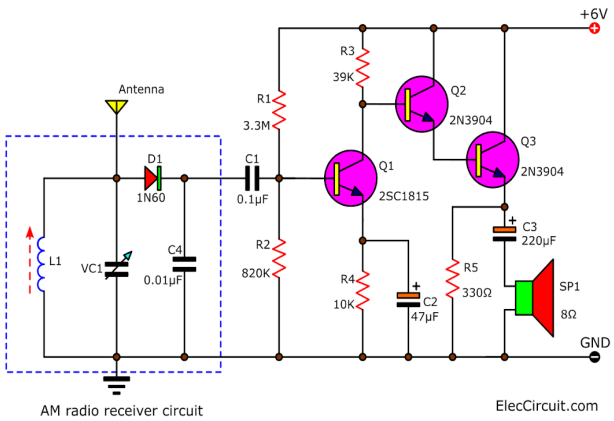
- GNN deconvolutes node relationships through neighbor information propagation in a deep learning architecture.
- Generate node embeddings based on local neighborhoods



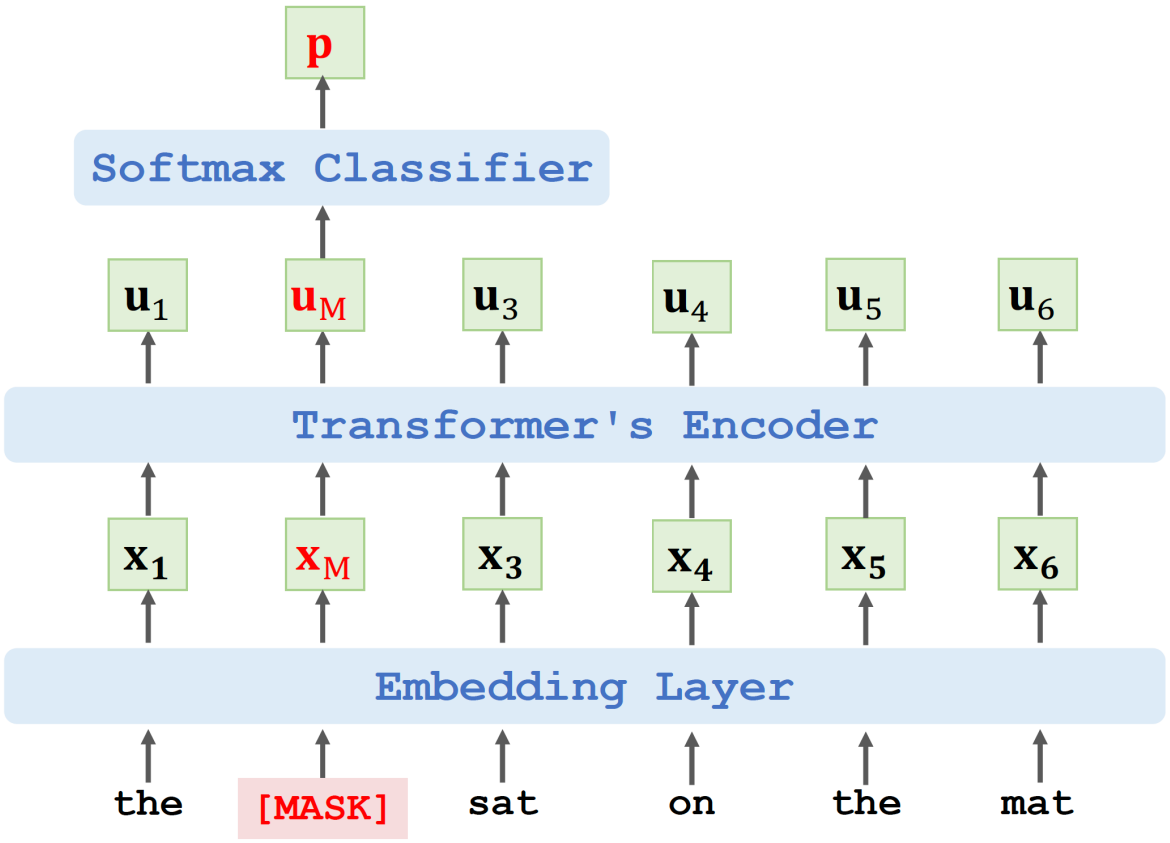
Foundation Model Era

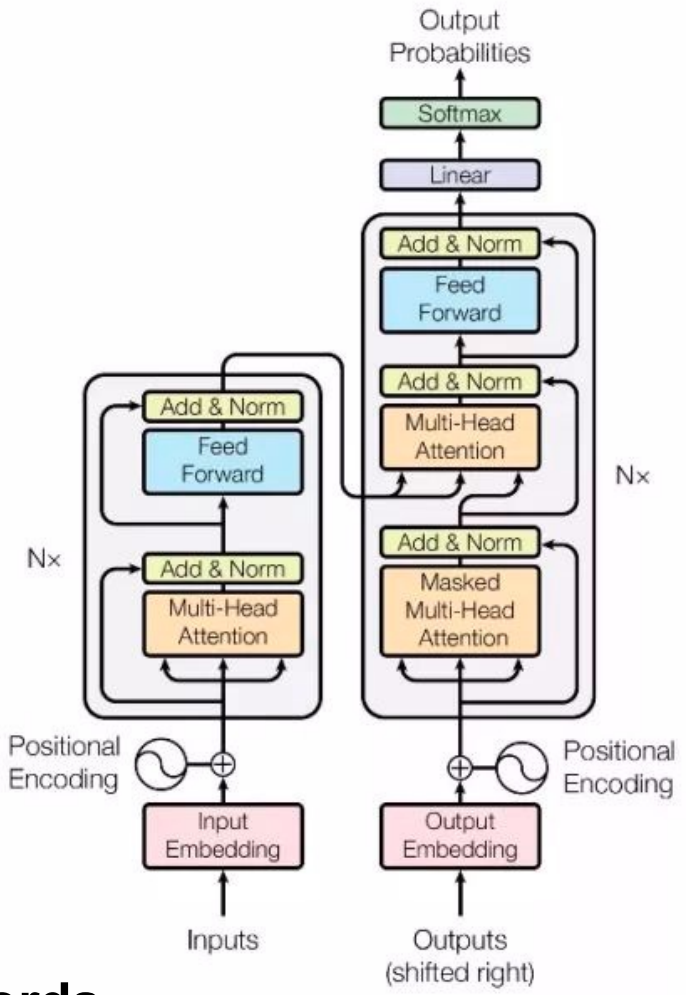
- Machine learning paradigms
  - **Feature engineering**: manual feature extraction (SVM, LightGBM, XGBoost)
  - **Architecture engineering**: raw features, design deep network (CNN, LSTM)
  - **Objective engineering**: pre-train large model and fine-tune it (ResNet50, Bert)
  - **Prompt engineering**: prompt **foundation model** in zero/few shots

- Industrial era of artificial intelligence



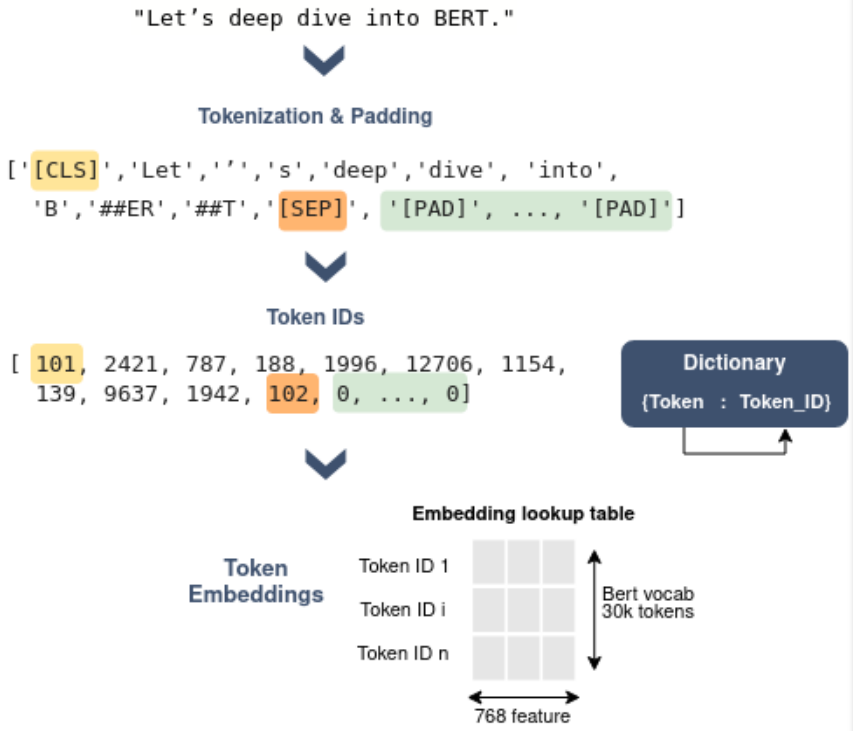
From Transformer to GPT

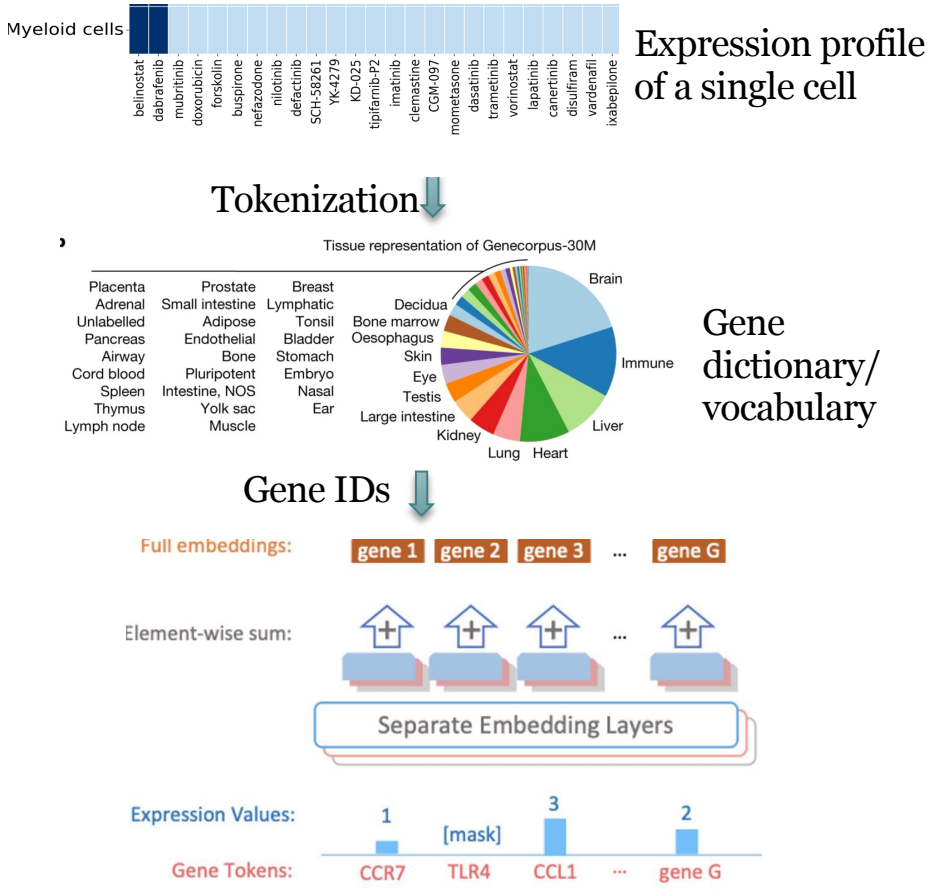




Self-supervised learning to predict missing words

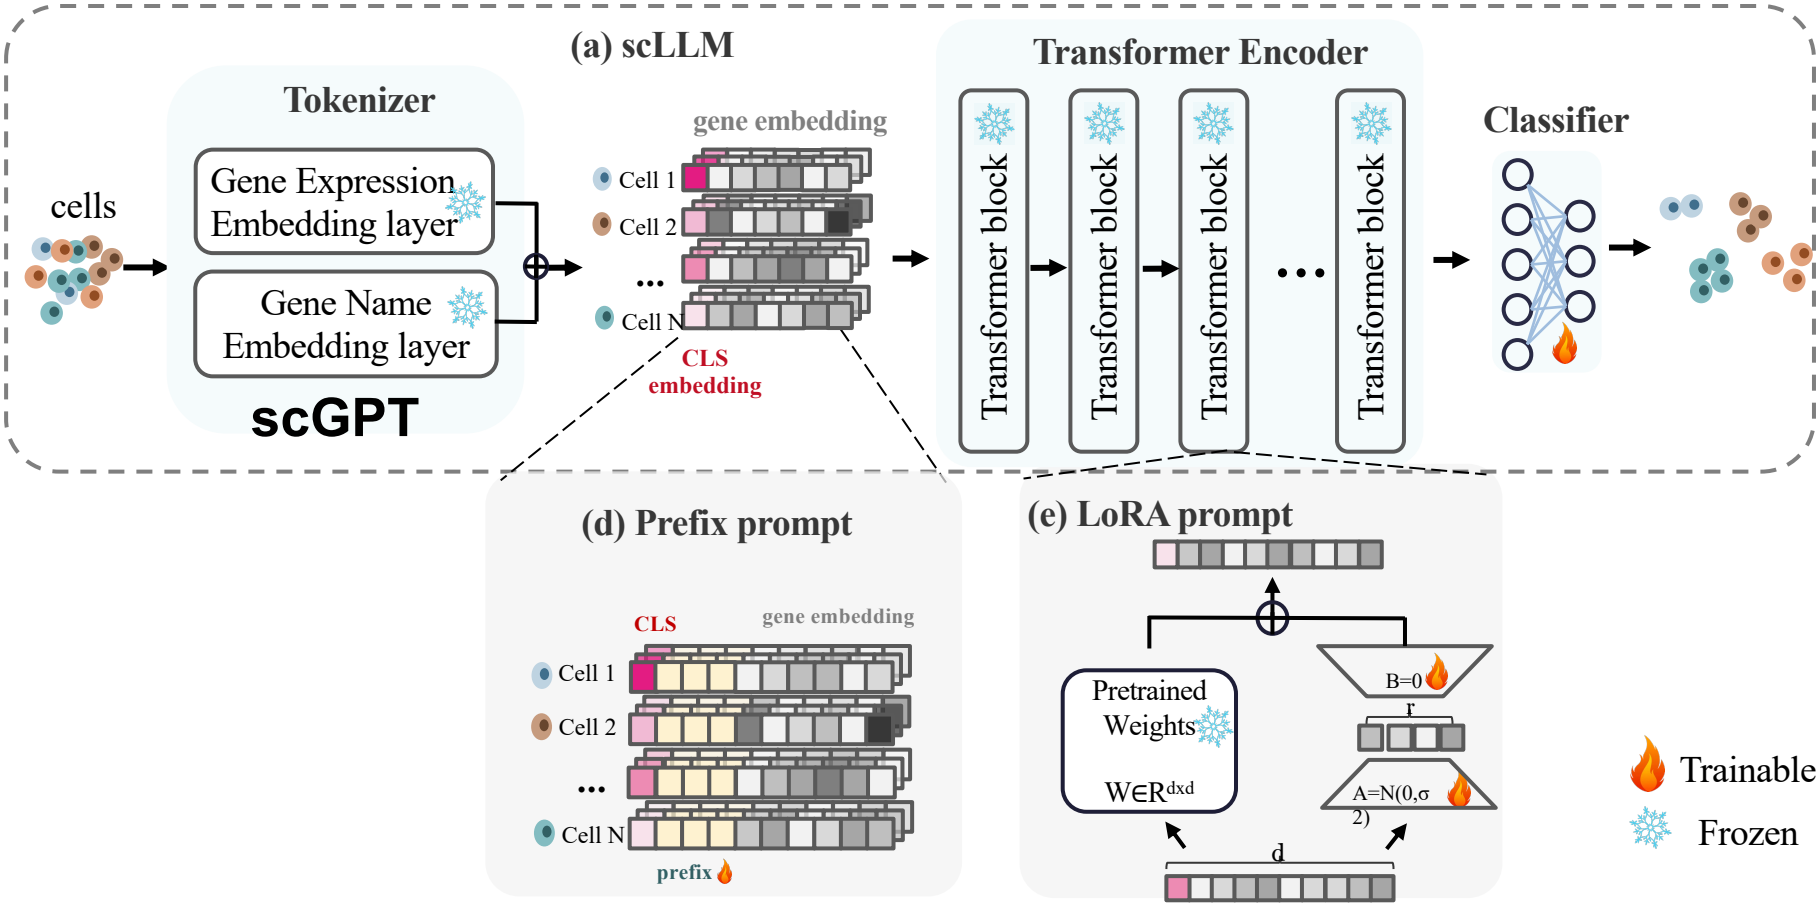
From LLM to Single-cell LLM





Embed gene expression values or gene expression order in each cell

Prompt-based Learning on scLLMs



Add small adapter to scLLM and train the adapter using small data

Summary

- Deep learning methods are evolving fast
- Deep learning add values for single-cell data analyses
- New opportunities to apply deep learning to extract more valuable insights from single-cell data
- Deep learning is not hard to learn and apply for practical purposes
